BEFORE YOU START

HOW TO USE THIS COURSE

This course has eight short videos and eight matching chapters. Work through them in order, because each chapter assumes the decision made in the one before it.

Watch one video, then come straight here and work through its chapter. Each chapter restates the method, gives you the worked example in full, and ends with one or two exercises you do on a real page you own. Write your answers in the space provided, since a sentence you have written in your own words is far easier to put on a live page than one you have only read.

One video and one chapter per sitting is enough. Several exercises ask you to collect customer language or watch a page for a few weeks, so the gaps between sittings are part of the work.

The checklist is for the day you sit down with a page. It walks you from the first count through the offer, the words, the blocks and the launch, as one list you can keep open on a second screen or print and keep beside you.

The prompt pack is for the desk work. Use it with any AI assistant to sort your customer quotes, draft each block of the page, rewrite a vague hero and score a live page. Treat every draft it hands you as a first attempt, and read each line aloud before it goes anywhere near a visitor.

The self-test near the end checks that the method stuck. The action plan on the last page is the short version, the moves in order, for the weeks after you have finished.

FIND THE LEAKS THAT COST YOU BUYERS

IN THIS CHAPTER

One Job You Can Count

The Rate Is Often the Cheaper Lever

Walk the Page as a Stranger

Exercise

Watch video 1, Find the Leaks That Cost You Buyers, then work through this chapter.

CHAPTER 1

FIND THE LEAKS THAT COST YOU BUYERS

ONE JOB YOU CAN COUNT

Every page you want to convert needs one job. One action the right visitor takes next, and one you can count.

Visitors often leave a page within 10 to 20 seconds, and the first ten decide most of it. A page offering a demo, a newsletter, a webinar and three different buttons makes a stranger work out which one matters. Few stay to do that work.

The test is one question. If this page worked, what would happen next? The answer has to be something you can count, such as a call booked, a checkout started or a quote requested.

"They understand us better" cannot be counted, so it is not a job. Secondary paths can still stay. A homepage goes on serving job seekers and existing customers through quieter links that do not compete with the main action.

THE RATE IS OFTEN THE CHEAPER LEVER

Once the job is named, the conversion rate is the share of visitors who do it. A page with 2,000 visitors a month and 20 inquiries converts at 1%.

If each visit costs $1.50 in ads, each inquiry costs $150. Lift the page to 2% and the same spend brings 40 inquiries at $75 each. Getting 40 at 1% would take another 2,000 visitors and another $3,000.

At a low rate, each point of conversion is worth as much as doubling or tripling the traffic. Your own current rate is the only benchmark that matters, so write it down before you change anything.

WALK THE PAGE AS A STRANGER

Now read the page from the top the way a visitor does, and note where it leaks.

What you check	What a leak looks like
The hero	Too vague to tell a stranger what they actually get
The offer	It reads like every competitor they have already scrolled past
The ask	The button wants a bigger commitment than they are ready to give
The proof	It arrives later on the page than the doubt it answers

The form	It asks for more than the moment deserves

Rank what you find by how much it costs you, then repair the biggest one first. A visitor who never understands the offer never reaches the proof, so the fixes run in the order a visitor meets them.

NAME THE ONE COUNTABLE ACTION YOUR PAGE EXISTS FOR, WRITE DOWN TODAY'S RATE, THEN RANK THE LEAKS BY WHAT EACH ONE COSTS YOU.

EXERCISE

Pick the page that matters most to your business. Write down its visitors and the number of times its one action happened over the last four weeks, then work out the conversion rate. If you pay for that traffic, work out what each conversion costs you today.

Write the page's job as one countable sentence, starting "get the right visitor to". Then list everything else the page currently asks a visitor to do, and mark which of those you will quieten.

LOCK YOUR OFFER BEFORE YOU BUILD

IN THIS CHAPTER

The One Sentence

Two Decisions That Come Before Design

Add Detail in the Order That Works

Exercise

Watch video 2, Lock Your Offer Before You Build, then work through this chapter.

CHAPTER 2

LOCK YOUR OFFER BEFORE YOU BUILD

THE ONE SENTENCE

Write down what the page sells in one sentence before you open a page builder. A template filled in before the offer is clear usually ends up rebuilt.

The sentence has three parts. **You help a specific customer get a specific outcome without a specific pain.** Each part has to be narrow enough that a stranger can tell at once whether it describes them.

"We help businesses grow with AI-powered marketing" could sit on thousands of websites. "We help small online shops cut returns without hiring a support team" tells the right visitor the page is for them, and lets everyone else leave.

Fill the three parts carefully. Customer is a role and a size, such as owners of online shops with one to five staff. Outcome is something they could check, such as fewer returns. Pain is the thing they want to avoid, such as hiring a support team.

TWO DECISIONS THAT COME BEFORE DESIGN

Pick one action. Book a call, start a trial, download a guide or buy. One page asks for one of these, and every button on it asks for the same one.

Pick one traffic source. A visitor from a search ad expects the words they searched for, while a newsletter reader already knows you. Write the top of the page for the source most of your visitors will come from.

With those three things written down, the builder choice is quick. Any mainstream page builder handles a one-page offer with a form, so pick the one you can publish with fastest unless the action is a purchase and you need payments.

ADD DETAIL IN THE ORDER THAT WORKS

If a competitor could paste your offer onto their own site without changing a word, the visitor cannot tell you apart. They fall back on comparing price and looks.

Specific detail makes an offer easier to believe, because the visitor can check it against their own situation. Compare "marketing strategy for growing businesses" with "a 30-day positioning and landing-page sprint for B2B service firms whose demo page books fewer than five calls a month". The second gives a buyer four handles to hold.

When an offer reads as generic, add detail in this order.

Layer	What you name
Audience	The buyer, rather than "businesses"

Pain	What sends them looking right now
Outcome	What changes when it works, in a form they can see
Mechanism	How you make the change happen
Boundary	Who it is not for, so the right buyer trusts you faster

Specific and jargon are different things. "Conversion-oriented revenue acceleration architecture" looks precise and means nothing. Use the words your buyer uses, so if they say "we need more qualified calls", the page says that too.

ONE SENTENCE, ONE ACTION, ONE TRAFFIC SOURCE. WRITE ALL THREE DOWN BEFORE YOU OPEN A BUILDER, AND EVERY HEADLINE AND BUTTON ON THE PAGE HAS A JOB TO DO.

EXERCISE

Rewrite each of these drafts as a real offer sentence for a business you know, with a customer, an outcome and a pain. "We help businesses grow with AI-powered marketing solutions." "We help teams ship better marketing faster with modern tools." "We help you take your conversions to the next level."

Now write your own offer sentence, name the one action your page asks for, and name the one traffic source most of your visitors will arrive from. Read

the sentence to someone outside your business and check they can say whether it describes them.

HARVEST THE WORDS YOUR CUSTOMERS WROTE

IN THIS CHAPTER

Why the Blank Page Keeps Failing

Where the Words Already Live

Listen Where They Talk Unprompted

Exercise

Watch video 3, Harvest the Words Your Customers Wrote, then work through this chapter.

CHAPTER 3

HARVEST THE WORDS YOUR CUSTOMERS WROTE

WHY THE BLANK PAGE KEEPS FAILING

The words that make a buyer stop and read are usually already written, by your customers, in reviews, tickets and forum posts. Your job is to collect them and put them back in front of the next buyer.

Writing them yourself fails for a reason with a name. The **curse of knowledge** means that once you know something well, you cannot imagine not knowing it. In a well-known study, people tapped the rhythm of a familiar song and predicted listeners would name about half of them. Listeners named 3 songs out of 120.

You know your product the way those tappers knew their songs. So you write "smart scheduling for busy professionals" for a booking app, while the salon owner who needs it is thinking "I'm so tired of texting people to confirm".

Asking an AI tool for headlines does not close the gap. Writers given AI ideas produce work that is judged better one piece at a time and is more alike as a group, which in copy means you sound like your competitors.

Their words	Written from your desk
"I'm so tired of texting people to confirm."	"Smart scheduling for busy professionals."
"Two no-shows this week and rent is due."	"Booking, simplified."
"I feel like a nag."	"The all-in-one tool to grow your business."

WHERE THE WORDS ALREADY LIVE

Start with reviews. The two-, three- and four-star reviews hold the most usable language, because the writer wanted the product to work and explains exactly where it let them down.

A three-star review of a rival booking app that says "sent a reminder to the wrong client and I looked like an idiot" gives you the stakes in words you would never have written. If your product is new and has no reviews, mine the reviews of books and tools your buyer already uses for the same problem.

Then add the places you already own, because they cost nothing and sit closest to the sale.

- Your own reviews, with the middle ratings read twice.

- Three competitors' reviews on app stores, search listings or software review sites.
- Reviews of books and tools next to your problem.
- Sales and demo call recordings, for the reason they almost did not buy.
- Support tickets and chat logs, for frustration with the heat still on.
- Cancellation emails and lost-deal notes, for why people leave.

Collect into one sheet with two columns, the quote word for word and where it came from. Keep the typos and the odd phrasing, because tidying comes later, if at all.

LISTEN WHERE THEY TALK UNPROMPTED

Reviews show people talking about a product. Communities show them talking about their problem with no product in view, which is where the plainest language lives.

Find the places your buyers already gather, such as a subreddit, a Facebook group, a Discord or Slack community, a trade forum or the comments under a popular creator in their field. Read months of posts and only observe. This way of listening is called a **sales safari**, and the rule is that you post nothing and pitch nothing.

Note four kinds of thing as you read. Pain is what they complain about, in their words. Jargon is the exact terms they use for it. Worldview is what they believe about the problem. Recommendations are what they tell each other to try.

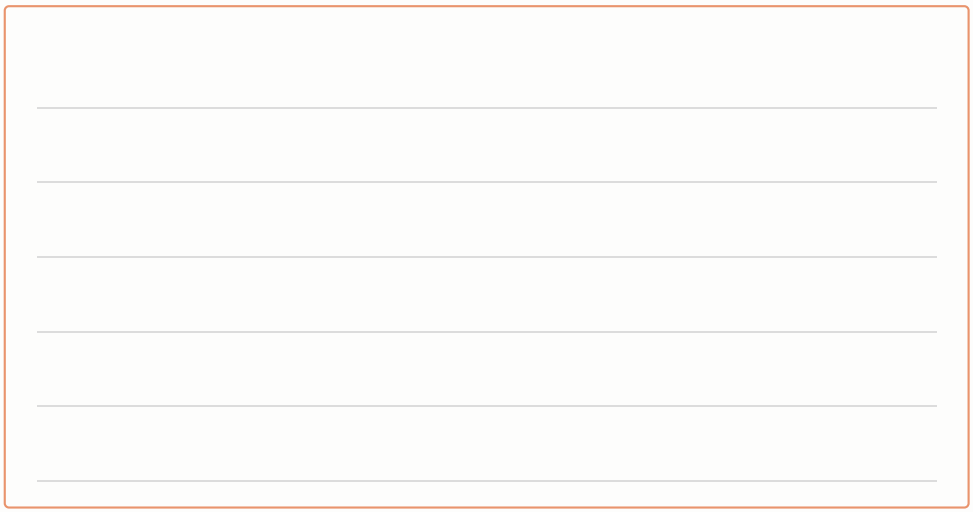

One thread can carry all four. A salon owner asks how others handle people who book and never show, because she is losing about $300 a week. The replies give you the jargon ("flakes", "ghosting"), a recommendation (take a deposit), a worldview ("clients don't respect your time anymore") and the stakes ("no-shows almost made me quit").

STOP GENERATING AND START HARVESTING. COPY YOUR BUYERS' SENTENCES WORD FOR WORD, WITH THEIR SOURCE BESIDE THEM, FROM AT LEAST FOUR DIFFERENT PLACES.

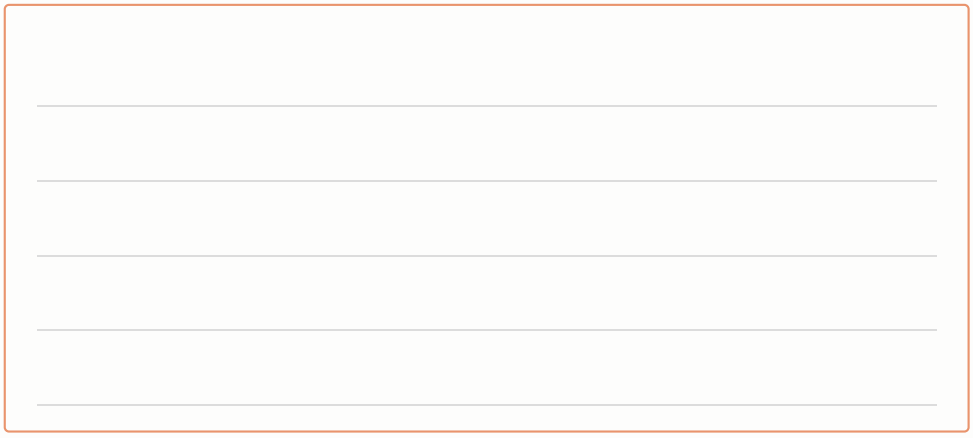

EXERCISE

Pick one product or service and one kind of buyer, and start one sheet with two columns for everything you collect. Spend thirty minutes in the two- to four-star reviews of one competitor and copy every usable sentence word for word, typos included. Then add quotes from your own reviews, your own

calls or tickets, and one community where your buyers talk. Keep going until the sheet holds at least thirty quotes from four or more places.

Read one community thread about the problem you solve and post nothing in it. Write down one line of pain, one piece of jargon, one worldview and one recommendation exactly as they appear.

COUNT WHAT BUYERS SAY MOST

IN THIS CHAPTER

Four Buckets for Every Quote

Group, Name, Count, Rank

Five Checks Before You Build on a Cluster

Exercise

Watch video 4, Count What Buyers Say Most, then work through this chapter.

CHAPTER 4

COUNT WHAT BUYERS SAY MOST

FOUR BUCKETS FOR EVERY QUOTE

A pile of forty quotes reads as noise until you tag each one by the job it does. Four buckets cover almost every customer sentence, and each bucket has its own place on a page.

Bucket	What it holds	Sounds like	Goes on the page as
Pain	What hurts now	"I'm so done chasing people to confirm."	Headline, opening hook
Desire	The outcome they want	"I just want my calendar to fill itself."	Subhead, benefit lines
Objection	What stops them buying	"I've tried these apps. They're always glitchy."	Lines next to the button, FAQ
Transformation	Who they become after	"Now I actually take Sundays off."	Testimonials, before and after

Add a **bucket column** to your sheet and tag every row. When a quote could sit in two buckets, ask what the person felt as they wrote it. Heat points to Pain, longing points to Desire, and a "but" usually hides an Objection.

Tag the quote as written and keep the customer's nouns. If they say "flakes" and "my chair", those are the words that will make the next salon owner recognize herself.

Then hold your current page against the four buckets. Many pages are loud in one and silent in another, all Desire with no Pain named in the buyer's words, or no answer to the objection that stops people signing up. Start your rewrite with the silent bucket.

GROUP, NAME, COUNT, RANK

Once every quote is tagged, count. A phrase that many different people use in their own words tells you what the market feels, while a phrase one person used is a guess.

People rarely repeat each other exactly. One owner writes "I look unprofessional", another "it makes me look like an amateur", a third "my clients probably think I'm flaky". That is one fear in three wordings, so they belong in one cluster.

Run four small steps. Group quotes by meaning inside each bucket, whatever the wording. Give each group a short handle in your own words,

such as "looks unprofessional", and keep the customer's phrasing in the quotes under it. Count how many different people said a version of it, counting two posts from one angry user once. Then sort the clusters by that count.

In a pile of 43 quotes for a booking app, 19 landed in Pain, and 11 of those 19 circled the same fear of looking unprofessional in front of clients. Nothing else came close, so that cluster is where the headline comes from.

Three people is a working threshold. Treat anything said by fewer than three people as unconfirmed until more turn up, and raise the threshold when you have hundreds of quotes.

FIVE CHECKS BEFORE YOU BUILD ON A CLUSTER

A phrase can be real, vivid and frequent and still point you at the wrong headline. Five checks catch most of those cases before you spend money on them.

Reviews and forums over-represent the extremes. People with strong feelings are far more likely to post than people with moderate ones, so the loudest complaint in your pile may come from a small, angry fringe your paying customers never mention.

People also describe the self they admire. A salon owner may say she wants "powerful analytics to grow my business" and then buy because the no-shows are eating her rent. Look for the moment they started looking for a fix, and trust that over the reason they give afterward.

- Enough different people said it, by your own count.
- The same idea shows up in your sales calls or tickets too.
- It names the moment that pushed them to act.
- It comes from someone who would pay for what you sell.
- It matches how the market talks this year.

A cluster that passes all five is safe to build on. One that fails a check gets checked again against another source, usually your own calls or tickets.

YOUR FAVORITE LINE EARNS ITS PLACE BY HOW MANY DIFFERENT BUYERS SAID A VERSION OF IT, AND BY WHETHER THOSE BUYERS ARE THE ONES WHO PAY YOU.

EXERCISE

Add a bucket column to your sheet and tag every quote as Pain, Desire, Objection or Transformation. Group the quotes that mean the same thing,

name each group, and count the different people behind it with repeat posters counted once. Mark every cluster under three people as unconfirmed.

Run your biggest cluster through the five checks above and write down which check it passes weakest. Then write which of the four buckets your current page leaves silent.

- How Good Voice Gets Killed
- Exercise

Watch video 5, Turn Customer Words Into Page Copy, then work through this chapter.

CHAPTER 5

TURN CUSTOMER WORDS INTO PAGE COPY

COLLECT THE PHRASES BEFORE YOU GENERATE

Asked cold for a headline, an AI tool returns the average of every page in your category. "Streamline your workflow." "Unlock seamless productivity." Those lines could sit on five thousand software homepages from the last decade.

A language model can only echo what you put in front of it. Feed it the category average and the copy stays flat, so hand it the exact words a frustrated customer typed instead.

Fifteen minutes gets you a page of material. Aim for 8 to 12 phrases and sort them into three groups, the pain, the outcome they want, and the words they use for your kind of product.

That third group matters more than it looks. If customers say "project tracker" and your page says "work management platform", the visitor has to translate, and some will not bother. A review that says "I keep losing track of which client said what in which email thread" gives you a headline almost as it stands, "Stop losing project details in email threads".

ONE BLOCK AT A TIME

Ask the AI for one block of the page at a time, with your offer, your customer phrases and a word limit. A request for the whole landing page gives you no control over any single part of it.

Block	Start from
Headline	8 words, one claim
Subhead	about 20 words that make the headline specific
Benefits	3 bullets of about 7 words, each an outcome
Problem	about 40 words in the customer's language
Questions	5 real objections, each answered in one or two sentences
Button	2 to 4 words naming the action

These are working limits to start from, so change one when a block clearly needs more room. **Name the words you do not want**, because without that line most tools fall back on the same stock vocabulary.

Ask for three versions labeled A, B and C. Read them aloud and keep the one that sounds least like an advert. The full block prompt sits in the prompt pack, ready to fill in.

FOUR MOVES FROM QUOTE TO LINE

A raw quote becomes copy through four small moves. Each one keeps the customer's words and changes as little as it can.

Move	What you do	From the quote	To the line
Lift	Use the quote as it stands	"Works fine until it doesn't."	Works fine until it doesn't.
Compress	Cut a rambling quote to its sharp phrase	"I'd switch tomorrow but every time I import my list half my contacts vanish."	Import your clients once. Nothing vanishes.
Flip	Answer an objection in its own words, beside the button	"These apps are always glitchy, I don't trust it."	Built so you never re-check the schedule by hand.
So that	Finish a feature with "so that" until you reach a phrase a customer used	"I feel like a nag texting them twice."	Automatic reminders, so you never text a client twice.

Try the lift first. When a clustered quote is short and exact, changing it usually makes it weaker.

Then place each line by its bucket. Pain goes in the headline, Desire in the subhead, Objection beside the button, Transformation in a testimonial. The line will often feel too plain to you, and that plainness is what makes it sound like the thought already in the reader's head.

HOW GOOD VOICE GETS KILLED

Most mined lines die between the sheet and the page, edited into something safer. Four habits do the damage.

Corporate paraphrase is the most common. "I feel like a nag texting them twice" ships as "Maintain a professional brand image", and every specific has gone.

Over-polishing happens one reasonable edit at a time. "Works fine until it doesn't" becomes "Reliable, right up until it isn't", then "Reliability you can trust", then "Rock-solid reliability, every time". Each step looks better on screen, and the last one sounds like every app in the store.

Cherry-picking builds a campaign on the line you happen to like, so check how many buyers said it first. Fabrication means writing a quote and putting it in a customer's mouth, and writing or buying fake reviews and testimonials

is explicitly banned in the US, the UK and the EU, with heavy fines. Check your local rules and quote only what a real customer said.

The test for the first two habits is to read the line aloud. If one of your buyers could say it to another buyer over coffee, it is still alive.

HAND THE AI YOUR CUSTOMER'S EXACT PHRASES, ASK FOR ONE BLOCK AT A TIME WITH A WORD LIMIT, AND CHANGE THE WINNING LINE AS LITTLE AS YOU CAN.

EXERCISE

Run the block prompt once for each block of your page, starting with the headline, using your offer sentence and five phrases from your sheet. Keep the version that sounds least like an advert, and write down which customer phrase made it into your headline.

Take three lines already live on your page and check each against your sheet. For each one, name which of the four habits it fell to, and rewrite it from a real quote using lift, compress, flip or "so that".

WRITE A HERO A STRANGER UNDERSTANDS

IN THIS CHAPTER

Three Things the Top of the Page Says

Read Your Favorite Line Cold

What the Eye Finds First

Exercise

Watch video 6, Write a Hero a Stranger Understands, then work through this chapter.

CHAPTER 6

WRITE A HERO A STRANGER UNDERSTANDS

THREE THINGS THE TOP OF THE PAGE SAYS

The top of the page has to tell a stranger three things. Who it is for, what changes for them, and what to do next. A headline that could sit on any company's site tells them none of the three.

"Unlock your business potential" names no buyer, no problem and no result. Compare **"Turn missed follow-ups into booked sales calls"**, with a subheading that adds how, a simple lead-tracking setup for service teams that need every lead followed up within 24 hours. A stranger reads it once and knows whether it is meant for them.

A drafting shape forces the three answers out. For [audience], get [outcome] without [the trade-off they dread]. You rarely publish that sentence as it stands, and you use it to find the real one, in the words your buyer would use in a meeting.

Specific can still be broad. If you serve several audiences, name the situation they share, such as "One place to track every customer handoff from signed contract to first invoice".

The buttons change with the headline. "Get Started" and "Learn More" ask for nothing in particular, while "Book a Demo" and "See the Workflow" name what happens when the visitor presses them.

READ YOUR FAVORITE LINE COLD

Write five alternatives in the drafting shape, then read your favorite cold with everything below it covered. Keep it only if a stranger could say who it serves and what they get.

A prompt in the prompt pack does the first pass for you. It tells you what a stranger would conclude from your current headline alone, writes five alternatives in the shape, and gives each one a subheading that says how the result happens.

WHAT THE EYE FINDS FIRST

Visitors scan before they read, so the layout has to show what to look at first, second and third. On an average visit people read at most about a quarter of the words on a page.

What they take in is what the layout made largest, darkest and most isolated. Hierarchy comes from a few deliberate choices, such as larger type for the main promise, one button style for the main action, quieter proof, more space around what matters, and fewer competing accents. A services page with fourteen equal cards becomes readable once the promise sits alone at the top, the three cards that answer real doubts stay, and the other eleven move to a details page.

Run the **squint test**. Step back from the screen or blur your eyes, and check you can still find the main headline, the primary button, the nearest proof and where the next section starts.

Close to 60% of web traffic worldwide now comes from phones, so check the same thing on a real phone held in one hand.

Desktop habit	Mobile edit
A headline that wraps to six lines	A shorter headline that still says who and what
A large image before anything else	The headline and button on the first screen, the image smaller or lower
Proof near the bottom	One proof line near the first button
A grid of cards	A short sequence, with the least useful cards cut
Small text links	Buttons large enough for a thumb

The current web accessibility guidelines set a floor of 24 by 24 pixels for anything a visitor taps, and bigger is easier for the main button. On a page built for one action, every link in the header is also a way out, so keep the logo, the primary action, login if customers need it, and one or two links that answer real doubts.

NAME THE READER, THEN THE RESULT, THEN THE THING THEY SKIP. READ IT COLD WITH THE REST OF THE PAGE COVERED, AND CHECK A STRANGER STILL GETS IT.

EXERCISE

Write five new versions of your hero in the shape "for [audience], get [outcome] without [trade-off]", using a line from your biggest confirmed Pain cluster. Pick one, give it a subheading that says how the result happens, and rewrite your two buttons so they name what happens next.

Screenshot your page, blur your eyes and write down the three things that stand out most. Then open the live page on a real phone and write what the first screen shows before any scrolling.

Exercise

Watch video 7, Build the Page in Seven Blocks, then work through this chapter.

CHAPTER 7

BUILD THE PAGE IN SEVEN BLOCKS

SEVEN BLOCKS AND THE QUESTION EACH ANSWERS

A landing page works when each block answers the question the block above it raises. Seven blocks cover the questions most visitors ask before they sign up.

Block	The visitor's question
Hero with headline, subhead and button	What is this, and is it for me?
Problem	Do they understand my situation?
Offer	What exactly do I get?
Proof	Has this worked for someone like me?
Benefits	What changes for me afterwards?
Questions	What is the catch?
Closing button	What do I do now?

The order is a starting point. Remove a block your visitors never ask about, and add one when a question keeps coming up in sales calls. A page selling to existing clients may need no problem block at all.

The closing button repeats the hero's action in the same words. Put the hero button where a visitor sees it without scrolling, on a phone as well as a laptop.

Build the skeleton first. Place seven empty boxes in order, open the preview on your phone, then fill one block at a time and fix what breaks before you move on.

MATCH THE ASK TO WHERE THE VISITOR IS

A button is a request for commitment. When it asks for more than the page has earned, the visitor leaves to build confidence somewhere else, and often does not come back.

Where the visitor is	An ask that fits
Never heard of you, comparing options	See examples, read a case breakdown
Knows the problem, weighing you up	See pricing, watch a two-minute demo
Ready and trusting	Book a call, start the order

Keep one primary action that fits most of the page's traffic, and add a secondary one only where it answers a real hesitation. A blog post that sends strangers to a page whose only button books a 45-minute call loses

most of them, while a second button saying "See three before-and-after examples" gives them a step they will take.

Do not swing to the other extreme. A ready buyer should not have to wade through three "learn more" clicks to act.

PUT PROOF AND ANSWERS WHERE THE DOUBT SITS

Proof exists to lower the risk of believing you. "Great team, highly recommend" may be true and still gives a visitor nothing to measure.

Compare "We came in with 41 open support tickets and no owner for renewals. Within six weeks every renewal had a named owner and overdue tickets were down by more than half." That names a starting point, a timeframe and a result a stranger can hold up against their own case.

From weakest to strongest, proof runs vague praise, star ratings, recognizable logos, specific testimonials, before-and-after examples, numbers with context, detailed case breakdowns, and a live sample or demo. Use the strongest proof you can honestly show, and place it where the visitor doubts you most. Honestly means real, so use your clients' own words with their permission and never invent, buy or rewrite a review, since many countries treat fake or misleading testimonials as illegal.

Doubts fall into four kinds, and each has a place on the page.

Doubt	The visitor asks	Where the answer goes
Fit	Is this for someone like me?	Beside the offer and audience copy
Value	Is it worth the cost?	Beside the price
Risk	What if I choose wrong?	Beside the commitment
Process	What happens after I click?	Directly at the button

Under a Book a call button, "No pitch on the first call. You leave with a page review, three fixes in order and a straight yes or no on fit" answers the process doubt and part of the risk doubt in one sentence. A hero promising "every lead followed up within 24 hours" can carry one client line directly beneath it, with the full case study further down for the people who want it.

Use the smallest proof that answers the doubt in front of the visitor. A page with a badge, a quote and a statistic in every section starts to look anxious.

ASK ONLY FOR WHAT YOU WILL USE

Every field on a form is one more thing a visitor has to decide to give you. Even online checkouts, where most fields have a purpose, ask for about **eleven fields on average when around eight would do**.

Work back from what happens after someone signs up. A guide sent by email needs an email address and nothing else. A booked call needs a name, an email and a time, and a phone number only if you will really ring it.

Sort every field into three piles. Needed now means the next step cannot happen without it, so keep it. Useful later gets asked on the call or during onboarding. Internal preference gets cut, or the field says why you need it.

Then put one line under the button saying what happens next and when. A consultation form can be work email, website and "What are you trying to improve?", followed by "You will get a reply within one business day, with a booking link or a clear reason we are not the right fit".

On a phone, every field gets its own full-width row, and the button is big enough to hit with a thumb. About three in five web visits worldwide now come from phones, so open the preview on your own phone after each block and fill in the form with one thumb. A free page-speed test measures how long the main content takes to appear, and 2.5 seconds or less counts as good. The usual fixes are a smaller hero image, fewer fonts and fewer extra scripts.

If the form also adds people to a mailing list, consent rules differ by country, so check your local rules before you collect addresses.

PLACE SEVEN EMPTY BOXES IN ORDER, FILL ONE AT A TIME, AND GIVE EVERY BLOCK THE ONE QUESTION IT EXISTS TO ANSWER.

EXERCISE

Place the seven blocks in your builder in order and fill each one with the copy you drafted. Cut the form to the fields your next step uses, add the line that says what happens after the button, and make the closing button repeat the hero's words.

Open the preview on your own phone, scroll the whole page once and fill in the form with one thumb. Write down what the phone showed that the builder's preview missed, and which fields you cut.

CHAPTER 8

FIX THE PAGE IN ORDER

FOUR STAGES SCORED ONE TO FIVE

When a page underperforms, fix it in the order a visitor meets it. Message earns attention, the ask earns the click, proof earns belief, and clearing friction earns the finish. Design lands last and polishes a path that already works.

A new color scheme, new type and a new layout feel like progress because you can see them. If the offer is still vague and the proof still soft, the page looks newer and converts the same. A redesign also changes so much at once that **nobody can tell which change made the difference**.

So make the audit repeatable. Score one real page from 1 to 5 on clarity, trust, action and friction. A page scored Clarity 2, Trust 3, Action 4 and Friction 3 starts with clarity, even if the form is what the team wants to redesign.

Make one change in the weakest stage, give it a few weeks of traffic, then score again and find the next weakest. Sometimes a rebuild is right, because the product changed, the audience changed or the site is broken, and the same order still runs inside the rebuild.

TWO COUNTS BEFORE YOU SHIP

Set up two counts before anyone visits the page. Clicks on the main button, and completed signups. Then test both with your own signup.

Together the two counts tell you where people stop. Say a week brings 600 visitors, 90 of them click the button and 12 finish the form. The button works, since 15% click it, and the form is losing most of the people who start it, so the form is what you fix first.

Count a signup only once it has gone through. The usual way is a thank-you page that appears only after a successful send, because a count that fires when the landing page loads records visits and calls them signups.

Before launch, open the page in a private browser window, click the button, sign up, and check that both counts show in your tool's live view within a minute or two. If you share the page with campaign tags in the link, write each tag the same way every time, in lower case, since some analytics tools treat "Facebook" and "facebook" as two separate entries. Analytics and recording tools often set cookies and many countries require consent first, so check your local rules.

CHANGE ONE THING AT A TIME

Improve the page one change at a time, and judge each change on enough signups to tell it from an ordinary week. Change three things at once and you cannot tell which one moved the number.

Small counts wobble. At 300 visitors a week and a true rate of 5%, you expect 15 signups, and **any week from about 8 to 22 is normal** with nothing changed. A new headline that lifts the true rate to 6% adds about 3 signups a week, well inside that wobble. At 3,000 visitors a week the same one point lift stands out.

On a small page, make changes big enough to matter, such as a new headline angle instead of a new word, and keep each one running for several weeks. Start with what every visitor sees, the headline, then the button text, then the form, then the proof.

In the first two days after launch, watch about twenty session recordings instead of staring at the conversion rate. Recordings show what numbers cannot, such as someone tapping an image they think is a button, scrolling past the form, or stopping at one field. Fix the most obvious problem you see, then leave the page alone and let the counts build.

One published test shows what a mined headline can do and how carefully to read the result. An addiction treatment center's landing page led with "Your Addiction Ends Here". A copywriter mined reviews of addiction and recovery books, found a reader's line, "If you think you need rehab, you do", and used it unchanged.

What was measured	Mined headline against the original
Clicks on the main button	More than 400% higher
Completed lead forms on the next page	More than 20% higher
Sample size and test length	Not published

The big number measured clicks. The figure the business cared about, completed lead forms, rose by about a fifth, which is a strong result and a much smaller one than 400%. Read any case study this way and find the metric behind the percentage before you quote it.

KEEP A LIVING WORD BANK

Keep every mined line in one sheet you open before you write anything. It turns a one-off research project into a source you reuse for every page, ad and email.

Seven columns are enough. The quote exactly as written, where it came from, its bucket, how many people said a version of it, the line you wrote from it, the place on the page it fits, and its status. A row starts as a draft, becomes confirmed once enough people have said it, and becomes live once it has been tested on a page.

Voice goes stale as markets change, so re-mine on a schedule. An hour in your two best places to listen every quarter, and a pass through the bank before every launch.

SCORE THE PAGE, FIX THE LOWEST STAGE, GIVE IT A FEW WEEKS, THEN SCORE AGAIN. THAT LOOP IS THE WHOLE METHOD.

EXERCISE

Score your page from 1 to 5 on clarity, trust, action and friction. Make one change in the lowest stage and leave everything else alone. After three weeks of traffic, work out the rate again and write down which stage is now the weakest.

Set up the two counts, run a test signup through both, then log visitors, button clicks and completed signups for each of the first two weeks. Write down which single change you will test next, and for how many weeks.

CHECK WHAT STUCK

SELF-TEST

1 A consultant's homepage carries a Book a call button, a newsletter signup, a webinar banner and a blog link. Which job statement gives this page something to be measured against?

- ☐ Help visitors understand what we do
- ☐ Get the right visitor to book a first call
- ☐ Give every visitor a route that suits them

2 Your draft offer reads "We help coaches get more clients without wasting time on social media". Which change makes it work hardest on the page?

- ☐ Add a second action for visitors who are not ready
- ☐ Name the kind of coach and their size, such as solo career coaches
- ☐ Replace "more clients" with "growth" so it covers more outcomes

3 You run a bookkeeping service for restaurants. What is the best first step toward a new homepage headline?

- ☐ Copy ten sentences restaurant owners wrote about their books, word for word
- ☐ Ask an AI tool for twenty headline options and pick the strongest
- ☐ Brainstorm with your team about what makes the service different

4 Your sheet holds one vivid Pain quote from a single reviewer, "this app made me cry at 2am", and a plain cluster of nine people saying they "waste every Sunday re-checking the schedule". Which do you build the headline on?

- ☐ The 2am quote, because it is the most emotional line in the sheet
- ☐ The Sunday cluster, because nine people said it
- ☐ Neither until you have 100 quotes

5 A salon owner writes "Honestly I'd switch tomorrow but I've imported my client list into three of these things now and every time half my contacts vanish". Which bucket does it belong in?

- ☐ Desire, because she says she would switch tomorrow
- ☐ Objection, because fear of a painful import is what stops her
- ☐ Transformation, because it describes life after switching

6 A salon owner wrote "I felt like a nag texting them twice". The page shipped "Maintain a professional brand image". Which habit killed the line?

- ☐ Corporate paraphrase

- [ ] Over-polishing
- [ ] Cherry-picking

7 Your hero reads "Smarter operations for modern teams". Which rewrite fixes what is wrong with it?

- [ ] Operations, reimagined for the teams of tomorrow
- [ ] For warehouse managers, ship every order the day it arrives without hiring for peak season
- [ ] Operations software that works the way you do

8 A visitor arrives from a comparison article, has never heard of you, and is weighing three vendors. Which button fits where they are?

- [ ] Book a strategy call
- [ ] See a two-minute example
- [ ] Request a custom quote

9 In a week your page gets 800 visitors, 24 clicks on the main button and 18 signups. Where should your next change go?

- [ ] The form, because 6 people who clicked did not finish
- [ ] The headline and first screen, because few visitors click at all
- [ ] Nowhere yet, because 18 signups is a good result

10 Your team wants a full redesign. The page's headline is vague, the proof is strong, and the form has four fields. What should happen first?

- [ ] Run the full redesign, since it will fix the headline along the way
- [ ] Rewrite the headline, measure for a few weeks, then score the page again
- [ ] Shorten the form further, since it is the easiest change

ANSWERS

1 b. A booked call is the only answer you can count each month and compare after a change, and the other links can stay as quieter paths.

2 b. "Coaches" covers life, sports and business coaches, so most visitors cannot tell whether the page is for them. Narrowing the customer does the most work.

3 a. Restaurant owners have already described the problem in their own words, and an AI tool asked cold returns the phrasing your category already uses.

4 b. Nine people describing the same lost Sunday is a pattern your market shares, while one vivid line said once stays unconfirmed.

5 b. The weight sits after the "but". She is afraid of another painful import, which tells you exactly what to say next to the signup button.

6 a. The nagging and the second text are gone, replaced by a phrase any competitor could run. Over-polishing works in small steps on a line that keeps its shape.

7 b. It names the buyer, a result they can check and the trade-off they want to avoid, which are the three answers a stranger needs.

8 b. A stranger comparing vendors has not yet seen a reason to trust you, so a short example is a step they will take now.

9 b. Only 3% of visitors click the button, while 75% of those who click go on to sign up, so the problem sits above the button.

10 b. Clarity is the first stage and the weak one. A redesign would change everything at once and hide whether the headline was the leak.

YOUR ACTION PLAN

THE MOVES, IN ORDER

1. Write down last month's visitors, conversions and rate for the page that matters most, and name its one countable job.
2. Write your offer sentence, pick one action and pick the one traffic source most visitors arrive from.
3. Spend an hour collecting at least thirty customer quotes word for word from four or more places, with sources beside them.
4. Tag every quote into Pain, Desire, Objection or Transformation, cluster them, count the people and mark anything under three as unconfirmed.
5. Draft one block of the page at a time from your top clusters, with a word limit and a do-not-use list, then read every line aloud.
6. Build or rebuild the page in seven blocks, cut the form to what your next step uses, and check every block on a real phone.
7. Set up the two counts, score the page on clarity, trust, action and friction, fix the lowest stage, then rescore after three weeks and repeat.

AMWARE

WORK WITH AMWARE

Want help turning visitors into buyers?

You've worked through the moves. If your site or app needs more than a rewrite, we can go through it together.

Your app needs a technical lead

Fractional CTO retainers for founders whose app keeps breaking, or whose vendor stopped answering.
